IMP Examples of Oral Defense Responses

Below are some types of responses that you will see in the oral defense.

Generic, nonsensical or unacceptably brief	Some relevant evidence relating to their project *(lacks details/specific examples)*	Relevant and specific details provided *(provides some real insight!)*
If I had more time I would definitely examine ALL of the employee effects that they have, all their mindsets, all their… how they base their business and what drives them, and also focus on the employer, and how they should focus on improving employee um, incentives and how they face their work because having a satisfied employee from a good consumer, will lead to a good consumer…I think it's important for the employer to be involved in this too. [nonsensical]	*I would conduct more research based on the solutions I provided...right now there aren't many versions of these solutions that have been actually implemented, mainly because people don't think of this as an issue, since yes jobs are being replaced but not been largely replaced quite yet but within the next 10 years we can see that. I'd spend time on developing these solutions and developing what kind of reactions people have such as the businessmen and whatnot. [doesn't give enough detail to address the why, how or rationale]*	*The evidence that I gathered that I didn't use mainly pertained to some of the physical effects of depression such as…often depression will cause other physical symptoms such as heart disease or cardiovascular problems, I decided to not include that because I wanted to stick to the psychology and how that part is affected – to stick to my prompt*
I did RAVEN, which is credibility, most of them were pretty accurate. [overly general]	*I feel very certain about my solutions, because although individually the 3 part solutions that I proposed which was X, Y, Z…although individually each of them does not solve the gender stereotyping issue in America – together each of them overlap the gaps they provide, especially Z, which solves the issue. [doesn't give enough detail to address the why, how or rationale]*	*A lot of my research was based on the direct effects that prison nurseries have on mothers such as psychological effects of depression and anxiety, but what I'd like to learn more about is what rights do mothers really have? Are they deemed unfit parents because they're in prison? Does that make them not allowed to actually raise their children in prison? Additionally if a family member of the child was brought to court to fight against the mother – who would win? What rights do each of the participating people have? Additionally…in my presentation I talk about how foster care is negative system that harms children because it opens them up to anxiety, stress and maltreatment, but is foster care more economically beneficial than prison nurseries? … is something I'd like to go further in to.*
I would get another perspective of workers, so you can see how it's affecting them, not just the workforce or like the CEOs but how it's affecting the people that use the technology. [simplistic and doesn't make sense in relation to the research]		
Well for like the solutions, there were no solutions on the internet because no-one knows how to solve it, so I found one internet that said that idea about how everyone has small guaranteed income, and it sounded kind of right, but it's still not that good, so there is probably a better solution in future. [simplistic, doesn't really address question]		*So initially I gravitated towards the Extra Sensory Perception article...and I was really interested in the use of not only the existing infrastructure, but also the use of sensors in commercial applications which is why I referenced Amazon Go and once I saw that I thought using the computer vision technology, since its been such a prominent part of the revolution of technologies of old, by applying this to source 5 in the stimulus packet, they mentioned how eyewitness testimony isn't always the most accurate option, so I thought using that technology and applying it to criminal investigations could allow for a kind of synthesis...*
